PATENT

In the specification

Please replace paragraph 19 with the following:

b²

[19] A mood-ring is one or more rules or criteria that determines what classes of messages to admit to non-volatile storage of a mobile station. Thus, mood-ring may also be referred as mode class. The rules associated with the mood ring (mood class) may be activated so that the rules are used by a processor when a message is received at the mobile station. Because the mood or situation of a user of a mobile station may change quickly and often, it is advantageous to minimize any keystrokes or other entries necessary to switch between mood-rings or add or remove a mood-ring from the set of mood-rings that are active or activated.
